                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            intracellular CoA concentration (By similarity).

CATALYTIC ACTIVITY: ATP + pantothenate = ADP + D-4'-
phosphopantothenate.

ENZYME REGULATION: Regulated by feedback inhibition by CoA and it
thioesters (By similarity).

PATHMAY: Coenzyme A (CoA) biosynthesis; first step.
SUBCELLULAR LOCATION: Cytoplasmic (Probable).

TISSUE SPECIFICITY: Highly expressed in the liver.
SIMILARITY: BELONGS TO THE EUKARYOTIC PANTOTHENATE KINASE FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     331 MKLLAYALDY 340
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           N

CC -:- TISSUE SPECIFICITY: Ubiquitous.

CC -:- DISEASE: Defects in PANK2 are the cause of pantothenate kinase-
CC -:- DISEASE: Defects in PANK2 are the cause of pantothenate kinase-
CC associated neurodegeneration (PKAN) (MIM:234200], formerly known
CC as Hallervorden-Spatz syndrome (HSS). PKAN is an autosomal
CC recessive neurodegenerative disorder associated with iron
CC commulation in the brain. Clinical features include
CC extrapyramidal dysfunction, and a relentlessly progressive course.
CC Atypical PKAN is diagnosed in individuals who may not fit with the
CC diagnostic criteria of PKAN yet have radiographic or pathologic
CC evidence of increased basal ganglia iron.
CC evidence of increased basal ganglia iron.
CC IDISEASE: Defects in PANK2 are the cause of
CC and pallidal degeneration (HARP) [MIM:607236]. HARP is a rare
CC syndrome with many clinical similarities to PKAN.
CC -- MISCELLANEOUS: The HSS syndrome has been proposed to be renamed to
CC PKAN because of the unethical activities of Julius Hallervorden

phosphopantothenate.

ENZYME REGULATION: Regulated by feedback inhibition by CoA and its thioesters. Strongly inhibited by acetyl-CoA and by manyl-CoA and thioesters. Strongly inhibited by acetyl-CoA and by manyl-CoA and thioesters.
                                                                                                                            regulatory domain.

SIMILARITY: BELONGS TO THE EUKARYOTIC PANTOTHENATE KINASE FAMILY.

CAUTION: Isoform 2, although confirmed in the murine ortholog, is

only partially cloned and needs a further complete identification.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  SUBUNIT: DNA polymerase III contains a core (composed of epsilon and theta chains) that associates with a tau subu core dimerizes to form the POLIII complex. PolIIII assoc with the gamma complex (composed of gamma, delta, delta, chi chains) and with the beta chain to form the complete polymerase III complex (By similarity).

SUBCELLULAR LOCATION: Cytoplasmic (By similarity).

SIMILARITY: BELONGS TO THE DNA POLYMERASE TYPE-C FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         FUNCTION: DNA POLYMERASE III IS A COMPLEX, MULTICHAIN ENZYME RESPONSIBLE FOR MOST OF THE REPLICANTURE SYNTHESIS IN BACTERIA. THIS DNA POLYMERASE ALSO EXHIBITES 3' TO 5' EXONUCLEASE ACTIVITY. THE ALPHA CHAIN IS THE DNA POLYMERASE (BY SIMILARITY). CATALLYIC ACTIVITY: N deoxynucleoside triphosphate = N diphosphate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      SUBFAMILY.

                                       The present invention describes the variable heavy and light chain regions (I) of murine monoclonal antibody (mAB) 1F7. AAY91014 to AAY91016 represent specifically claimed amino acid sequences of the variable light chain, and AAY91017 to AAY91019 represent specifically claimed amino acid sequence of the variable heavy chain. The antibodies are used for treatment of HIV (human immunodeficiency virus) infection and AIDS (acquired immunodeficiency syndrome). They are also used for detecting HIV in serum and for stimulating HIV antigen related and committed B cells to produce broadly reactive and neutralising antibodies
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to coding sequences of the murine 1F7 anti-idiotypic antibody complementarity-determining region (CDR) or framework-determining region (FR). The antibody binds to human or primate anti-human immunodeficiency virus (HIV) antibodies and can be used in the treatment of HIV infection. The present sequence is a region of the 1F7
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            region of an anti-idiotypic antibody that binds to human or primate anti- human immunodeficiency virus (HIV) antibodies, for use in vaccines against HIV -

                                                                                                                                                                                    RESULT 5
                                                                                                                                                                                                                                                                                                                                                                              CC This sequence is a mutant of the variable heavy (VH) chain of the CC antibody TM27. TM27 is an immunoglobulin G (IgG) antibody, contained in CC the isotonic pharmaceutical formulation of the invention, along with a CC citrate buffer at a physiologically acceptable pH. The formulations are CC disease, and particularly, therapy of multiple sclerosis (using the TM27 CC antibody heavy or light chains). The formulation is useful for improving CC effective. The formulations are stable and have improved storage of an antibody. The antibody formulations are simple and CC effective. The formulations are stable and have improved storage CC properties. The formulations require the use both of a stabiliser and a buffer. The present invention formulations are stabilized only by citrate buffer in a saline solution at a physiologically preferable pH. The CC avoidance of low pH prevents undesirable reaction as the site of CC injection. The formulation does not use ovalbumin for stabilisation, CC does not require lyophilisation which is an expensive process and also requires the formulation to be resuspended prior to administration.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       CC This sequence represents the variable heavy (VH) chain of the cantibody TM27. TM27 is an immunoglobulin G (IgG) antibody, contained in CC the isotonic pharmaceutical formulation of the invention, along with a CC citrate buffer at a physiologically acceptable pH. The formulations are CC useful in medical therapy, especially for treatment of autoimmune CC disease, and particularly, therapy of multiple sclerosis (using the TM27 CC antibody heavy or light chains). The formulation is useful for improving CC effective. The formulations are stable and have improved storage CC properties. The formulations is simpler than prior art formulations. CC Existing antibody formulations require the use both of a stabiliser and a CC buffer. The present invention formulations are stable only by citrate CC injection. The solution at a physiologically preferable pH. The CC avoidance of low pH prevents undesirable reaction as the site of CC injection. The formulation does not use ovalbumin for stabilisation, CC hence avoiding an allergic response to ovalbumin for stabilisation, CC does not require lyophilisation which is an expensive process and also CC requires the formulation to be resuspended prior to administration.
                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This sequence is a mutant of the variable heavy (VH) chain of the antibody TM27. TM27 is an immunoglobulin G (IgG) antibody, contained in the isotonic pharmaceutical formulation of the invention, along with a CC citrate buffer at a physiologically acceptable pH. The formulations are useful in medical therapy, especially for treatment of autoimmune CC disease, and particularly, therapy of multiple sclerosis (using the TM27 CC antibody heavy or light chains). The formulation is useful for improving the storage of an antibody. The antibody formulations are simple and ceffective. The formulations are stable and have improved storage CC properties. The formulations are stable and have improved storage CC properties. The formulations require then prior art formulations. CC buffer. The present invention formulations are stabilized only by citrate buffer in a saline solution at a physiologically preferable pH. The CC avoidance of low pH prevents undesirable reaction as the site of injection. The formulation does not use ovalbumin for stabilisation, chance avoiding an allergic response to ovalbumin. Also the formulation. CC does not require the physhilisation which is an expensive process and also crequires the formulation to be resuspended prior to administration.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This sequence is a mutant of the variable heavy (VH) chain of the cantibody TM27. TM27 is an immunoglobulin G (IGG) antibody, contained in CC the isotonic pharmaceutical formulation of the invention, along with a cCC citrate buffer at a physiologically acceptable pH. The formulations are useful in medical therapy, especially for treatment of autoimmune CC disease, and particularly, therapy of multiple sclerosis (using the TM27 CC antibody heavy or light chains). The formulation is useful for improving the storage of an antibody. The antibody formulations are simple and CC effective. The formulations are stable and have improved storage CC properties. The formulations require the use both of a stabiliser and a buffer. The present invention formulations are stabilized only by citrate buffer in a saline solution at a physiologically preferable pH. The CC avoidance of low pH prevents undesirable reaction as the site of injection. The formulation does not use ovalbumin for stabilisation, chence avoiding an allergic response to ovalbumin for stabilisation. Cc does not require lyophilisation which is an expensive process and also CC requires the formulation to be resuspended prior to administration.
                                                                                                                                                                                                                                                                                                                                                                                                                     Best Loc

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This sequence is a mutant of the variable heavy (VH) chain of the CC antibody TM27. TM27 is an immunoglobulin G (IgG) antibody, contained in CC the isotonic pharmaceutical formulation of the invention, along with a CC citrate buffer at a physiologically acceptable pH. The formulations are CC useful in medical therapy, especially for treatment of autoimmune CC disease, and particularly, therapy of multiple sclerosis (using the TM27 CC antibody heavy or light chains). The formulation is useful for improving CC the storage of an antibody. The antibody formulations are simple and CC effective. The formulations are stable and have improved storage CC properties. The formulations require then use both of a stabiliser and a CC buffer. The present invention formulations are stabilized only by citrate CC conjection. The solution at a physiologically preferable pH. The CC avoidance of low pH prevents undesirable reaction as the site of CC injection. The formulation does not use ovalbumin for stabilisation, CC does not require lyophilisation which is an expensive process and also CC remaining the formulation of the reaction as the site of the formulation of the process and also considered the process and also considered the process and also considered the process and also considered the process and also considered the process and also considered the process and also considered the process and also considered the process and also considered the process and also considered the process and also considered the process and also considered the process and also considered the process and also considered the process and also considered the process and also considered the process and also considered the process and also considered the process and also considered the process and also considered the process and also considered the process and also considered the process and also considered the process and also considered the process and also considered the process and also considered the process and also considered the process and p

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               CC polymerase chain reaction (PCR) primers, oligomers, and for chromosome CC and gene mapping, and in recombinant production of (II). The CC polymucleotides are also used in diagnostics as expressed sequence tags to restore normal activity of (II) is useful in gene therapy techniques (II). (II) is useful for generating antibodies against it, detecting or CC (II). (II) is useful for generating antibodies against it, detecting or CC quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating CC diagnostics, forensics, gene mapping, identification of mutations in CC diagnostics, forensics, gene mapping, identification of mutations (CC responsible for genetic disorders or other traits to assess biodiversity amino acid sequences of the invention.

CC and to produce other types of data and products dependent on DNA and camino acid sequences of the invention.

CC diagnostic amino acid sequences of the invention.

CC diagnostic amino acid sequences of the invention.

CC diagnostic amino acid sequences of the invention.

CC diagnostic amino acid sequences of the invention.

CC diagnostic amino acid sequences of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to 446 newly isolated polynucleotide sequences. The activity of polynucleotides of the invention may be described as, vulnerary, neuroprotective, immunomodulator, cytostatic and anti-inflammatory. Compositions comprising nucleic acids of the invention are useful for treating a mammalian subject, or as nutritional sources or supplements. These are useful in gene therapy, particularly for treating wounds, burns or ulcers, Alzheimer's disease, Huntington's disease,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           amyotrophic lateral sclerosis, autoimmune disorders, cancer or inflammation. The nucleic acids and polypeptides are also useful in diagnostic and research methods. The sequences given in records ABP43544-ABP43989 represent polypeptides encoded by polynucleotides

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention comprises the amino acid and coding sequences of human nucleic acid-associated proteins (NAAP). The DNA and protein sequences of the invention are useful for diagnosting, treating or preventing disorders associated with aberrant expression of NAAP, such as: cell proliferative disorders (e.g. arteriosclerosis, atherosclerosis, cirrhosis, hepatitis or cancer); developmental disorders (e.g. renal tubular acidosis, anaemia or mental retardation); neurological disorders (e.g. Alzheimer's disease, Parkinson's disease or epilepsy); and autoimmune/inflammatory disorders (e.g. AIDS, allergies, asthma or Crohn's disease). The DNA sequences of the invention are useful for creating transgenic animals to model human the sequences of the sequences of the sequences of the sequences of the sequences of the sequences of the sequences of the sequences of the sequences of the sequences of the sequences of the sequences of the sequences of the sequences of the sequences of the sequences of the sequences of the sequences of the sequences of the sequences of the sequences of the sequences of the sequences of the sequences of the sequences of the sequences of the sequences of the sequences of the sequences of the sequences of the sequences of the sequences of the sequences of the sequences of the sequences of the sequences of the sequences of the sequences of the sequences of the sequences of the sequences of the sequences of the sequences of the sequences of the sequences of the sequences of the sequences of the sequences of the sequences of the sequences of the sequences of the sequences of the sequences of the sequences of the sequences of the sequences of the sequences of the sequences of the sequences of the sequences of the sequences of the sequences of the sequences of the sequences of the sequences of the sequences of the sequences of the sequences of the sequences of the sequences of the sequences of the sequences of the sequences of the sequences of the sequences of the sequences of the sequences of the sequen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New nucleic acid-associated proteins and polynucleotides, useful for diagnosing, treating or preventing cell proliferative (e.g. cancer), neurological (e.g. epilepsy or Parkinson's disease), or autoimmune disorders (e.g. AIDS)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    29-JUN-2001; 2001US-301787P

The cDNAs encoding humanised heavy (IgG1) and light (K) chains in mammamlian cell expression vectors with Neo and DHFR selection markers, respectively, were transfected into a DHFR- Chinese hamster fibroblast (CHO) cell line followed by selection and amplification. The humanised MAb that was secreted was designated "TM27", and maintains specificity for human TCR V beta 5.2 and 5.2. It is used as a therapeutic agent for human multiple sclerosis. TM27 is a mutant with Leu at posn. 48 of heavy

AAY91055 to AAY91071 represent ORF protein sequences encoded by the gene cluster. Nogalamycin is an anthracycline antibiotic, so the nogalamycin biosynthetic pathway is also known as the anthracycline biosynthetic pathway. DNA fragments, plasmids and process from the present invention are useful for obtaining novel hybrid antibiotics, such as anthracyclines (antitumour antibiotics) or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Isolated and purified DNA fragment for obtaining novel hybrid antibiotics comprises the gene cluster for the anthracycline biosynthetic pathway of the bacterium Streptomyces nogalater
Sequence
                                     The H chain variable region is from an immunoglobulin with anti-HIV neutralising activity. See AAN90491, AAN90493 and AAN90495.
